

Como Movimento o Jogador?

- 1. Definimos as constantes de movimento
- 2. Obtemos a entrada do teclado
- 3. Movemos o jogador
- 4. Controlamos o limite da tela para o jogador não sair

Arrow Key Controls

- Set up movement constants
- Poll for arrow key input
- Move the player
- Keep the player in-bounds

Classe Constants.java

A d i c i o n a m o s a c Constants.java × constante que define a velocidade do jogador ao se movimentar

 C Constants.java × package con package con import com import com import com constants.java × package con package con

```
package com.udacity.gamedev.icicles;
       import com.badlogic.gdx.graphics.Color;
       public class Constants {
           public static final float WORLD_SIZE = 10.0f;
           public static final Color BACKGROUND_COLOR = Color.BLUE;
           public static final float PLAYER_HEAD_RADIUS = 0.5f;
10
           public static final float PLAYER_HEAD_HEIGHT = 4.0f * PLAYER_HEAD_RADIUS;
11
           public static final float PLAYER_LIMB_WIDTH = 0.1f;
           public static final int PLAYER_HEAD_SEGMENTS = 20;
13
           public static final Color PLAYER_COLOR = Color.BLACK;
14
15
           // TODO: Add Constant for player movement speed
16
           public static final float PLAYER_MOVEMENT_SPEED = 10.0f;
17
18
           public static final float ICICLES_HEIGHT = 1.0f;
19
           public static final float ICICLES_WIDTH = 0.5f;
20
           public static final Color ICICLE_COLOR = Color.WHITE;
21
22
23
```

Classe Player.java

• Testamos a entrada do teclado através do módulo Gdx.input com o método isKeyPressed() que verifica se a tecla passada como parâmetro foi pressionada (constantes em Keys.java)

```
Player.java X
            public void update(float delta) {
28
                // TODO: Use Gdx.input.isKeyPressed() to move the player in
                    the appropriate direction when an arrow key is pressed
30
                if (Gdx.input.isKeyPressed(Keys.LEFT)) {
31
                    position.x -= delta * Constants.PLAYER_MOVEMENT_SPEED;
32
                } else if (Gdx.input.isKeyPressed(Keys.RIGHT)) {
33
                    position.x += delta * Constants.PLAYER_MOVEMENT_SPEED;
34
35
36
                ensureInBounds();
```

Classe Player.java

• E precisamos limitar a movimentação do jogador caso ele exceda os limites do nosso jogo (inferior a zero ou superior a largura da tela - getWorldWidth())

```
private void ensureInBounds() {

// TODO: Complete this function to ensure the player is within the viewport

if (position.x - Constants.PLAYER_HEAD_RADIUS < 0) {

position.x = Constants.PLAYER_HEAD_RADIUS;

}

if (position.x + Constants.PLAYER_HEAD_RADIUS > viewport.getWorldWidth()) {

position.x = viewport.getWorldWidth() - Constants.PLAYER_HEAD_RADIUS;

}
```

```
public void render(ShapeRenderer renderer) {
50 @
                renderer.setColor(Constants.PLAYER_COLOR);
51
                renderer.set(ShapeType.Filled);
                renderer.circle(position.x, position.y, Constants.PLAYER_HEAD_RADIUS, Constants.PLAYER_HEAD_SEGMENTS);
53
54
               Vector2 torsoTop = new Vector2(position.x, y: position.y - Constants.PLAYER_HEAD_RADIUS);
55
                Vector2 torsoBottom = new Vector2(torsoTop.x, y: torsoTop.y - 2 * Constants.PLAYER_HEAD_RADIUS);
56
57
                renderer.rectLine(torsoTop, torsoBottom, Constants.PLAYER_LIMB_WIDTH);
58
                renderer.rectLine(
60
                        torsoTop.x, torsoTop.y,
61
                        x2: torsoTop.x + Constants.PLAYER_HEAD_RADIUS, y2: torsoTop.y - Constants.PLAYER_HEAD_RADIUS,
62
                        Constants. PLAYER_LIMB_WIDTH);
63
                renderer.rectLine(
64
                        torsoTop.x, torsoTop.y,
65
                        x2: torsoTop.x - Constants.PLAYER_HEAD_RADIUS, y2: torsoTop.y - Constants.PLAYER_HEAD_RADIUS,
